

# THE PORT OF KRIBI

### PORT EXPANSION PROJECTS: DEVELOPING TRANSPORT FACILITIES CONNECTED TO SEAPORTS

#### BACKGROUND

Connectivity has been recognized as one of the most critical issues in port competitiveness and development in most ports around the world

#### PORT HINTERLAND CONNECTION

Port hinterland connectivity explained in three related domains: maritime hinterlands, inland hinterland corridors, hinterland traffic in port cities.

#### **PORT OF KRIBI**

Presentation of the of Kribi after 2 years of operations, available transportation facilities connecting to the hinterland and achievements so far.

#### **EXPANSION PROJECTS**

Future expansion projects: the port of Kribi and port land, investment opportunities, expanding city, incentives and development of transport facilities.

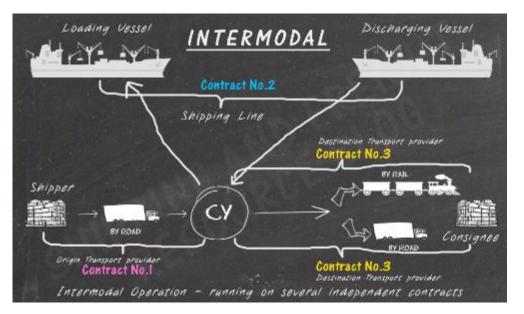

# BACKGROUND

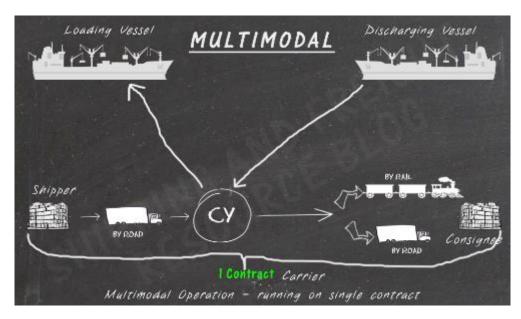

### INTRODUCTION

#### MULTIMODAL TRANSPORT FACILITIES

Intermodal Transport : The movement of cargo from origin to destination by several different methods of transport with the specificity that each of these modes has a different transport carrier with its own independent contract

Multimodal Transport : The movement of cargo from origin to destination by several modes of transport where each of these modes has a different carrier responsible, but under a single contract or bill or lading.

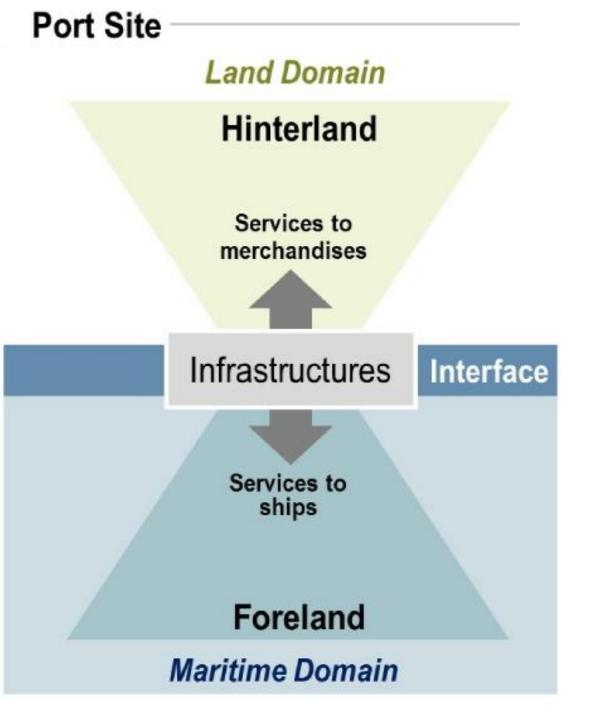

# **PORT HINTERLAND CONNECTION**

## Port location is constrained by two physical characteristics : the first involves land access and the second concerns maritime access.

- The competitiveness of a seaport depends on the extent to which the cargo handled in the port can reach its hinterland destination.
- The importance of hinterland connections is an essential issue in port competitiveness and development.
- Upgrading of facilities and equipment, optimization of port operations and increased sophistication of berth planning will only exacerbate the bottlenecks related to port hinterland connectivity if the improvement of port-hinterland connectivity is not followed.

#### Improvement of Port-hinterland connectivity is crucial for the development of the Port

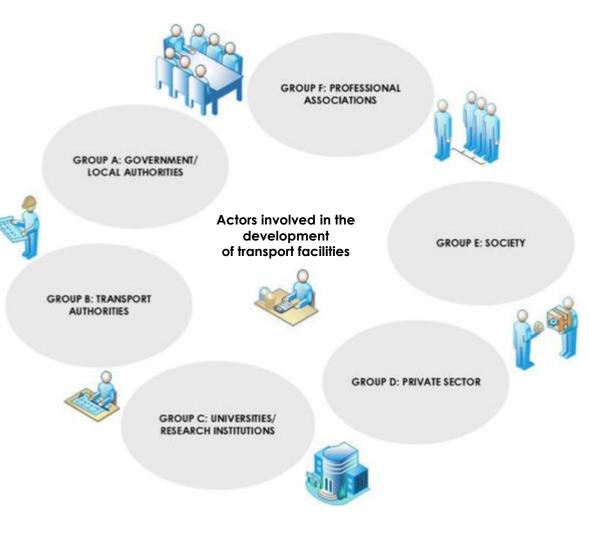

## **PORT-HINTERLAND CONNECTIVITY**

One of the main issues related to the development of adequate hinterland connections in ports is the need to coordinate multiple actors often with conflicting mandates that constitute the mêlée of private and public institutions governing port hinterland infrastructure development.

The development of transport facilities connected to seaports seeks to address and solve the main porthinterland connectivity challenges. Three domains of port hinterland connectivity are identified notably:

- 1. Maritime hinterland (Inland water ways);
- 2. Inland hinterland corridors (inter-city trade corridors)
- 3. Hinterland traffic in Port cities

The development of transport facilities associated with these port-hinterland connectivity domains ensures the competitivity of the port, considerably reduces turnaround times, and increases port traffic.

## **TRANSPORT FACILITIES CONNECTED TO SEAPORTS**

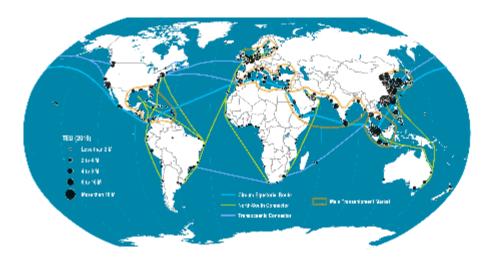

#### Maritime hinterland Connectivity

Although not a popular option, coastal shipping has a lot of potential and the development of coastal shipping transport facilities provides several benefits :

- it provides direct point to point routing
- serves as a solution for inter-city traffic and urban congestion
- Allows for the transportation of larger cargo at once
- It is ideal for the transport of heavy and hazardous cargo such as chemicals
- Often provides shorter times compared to ground transport
- Is generally cheaper than ground transport

Developing coastal shipping facilities can be done by :

- Improvement of coastal shipping channels and creation of dedicated coastal shipping terminals
- Subsidizing coastal shipping as a means to address inter-city traffic and urban congestion

## **TRANSPORT FACILITIES CONNECTED TO SEAPORTS**

#### Inland hinterland corridor connectivity

For competitiveness of a port, the development of trade corridors is essential. Market access, fluidity of trade and industrialization can be improved by integrating the port with a multimodal network.

The quality and capacity of hinterland modalities; rails, roads and relays are essential to any expansion of trade, both internal and external.

Two main methods of transport address the inland hinterland corridor connectivity challenge:

- 1. Transport via highways;
- 2. Transport via railways.

## **TRANSPORT FACILITIES CONNECTED TO SEAPORTS**

#### Hinterland Traffic in port cities

Port connectivity is also influenced by in-city road congestion, the former contributing to overall port turn around times.

As port cities development, road congestion increases when road development does not follow urban growth.

Reducing port-related road congestion leads to increased turn around time within the Port.

In practice, the hinterland traffic of most ports is dominated by trucks. Several strategies can be used to manage truck traffic, notably :

- The creation and implementation of terminal gate appointment systems (priority given to trucks who subscribe to preset times) ;
- The attribution of incentives for off-peak traffic ;
- The creation of dedicated freight routes

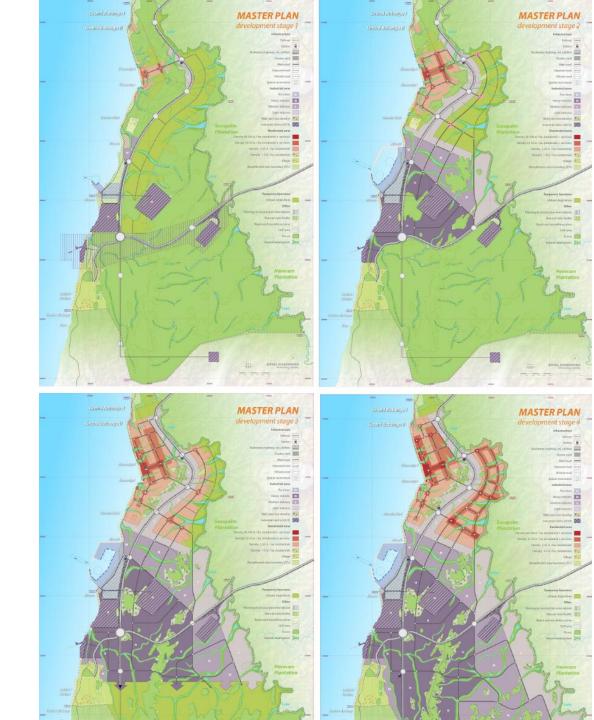

# **PORT OF KRIBI**

#### **DEVELOPMENT OF THE PORT OF KRIBI**

- The ambition of the Industrial Port of Kribi or Kribi Port Industrial Complex (CIPK) is, to build in a CONCOMITING AND PROGRESSIVE manner, over an area covering 260 km2;
- It intends to develop an economic development centre with port facilities, along with an industrial port area covering approximately 20,000 hectares.
- It also intends to develop an urban area covering 4000 hectares and a network of high-quality infrastructure (motorway, railways, optical fibre, sanitation network, drinking water supply network, electrical power supply network, etc.).

## THE PORT OF KRIBI

Phase 1 of the Kribi Deep Sea Port was completed in 2014 and commissioned on March 30th 2015. Carried out as part of a lump sum turnkey contract, it included:

- A harbor protection dike approximately 1,350 m long;
- Dredging of maneuvering and navigation areas (access channel and ship turning circle);
- A collinear quay wall with a total length of approximately 615 m divided into a 350 m container quay and a 265m multipurpose quay;
- The construction of the necessary backfill behind the quay wall;
- The construction of base layers and coatings for interior traffic lanes and goods storage platforms; Construction buildings, stores and other of superstructures;
- The supply of the equipment necessary to start the operation of the port (handling, tugs, IT, etc.).

## THE PORT OF KRIBI AT A GLANCE

#### Multipurpose terminal

265m 1.2 million tons/year 4000sq.m plus covered warehousing space 2 boom cranes for heavy loads 14ha of open space On board and onshore handling equipment **Accessibility** 

#### 24/7 Access Access channel, berth, landing 600m diameter turning zone Break water for safe docking Guidance to vessels for access (IALA standards)

#### Structure

650m long 200 wide and 17m deep channel

Service capacity for vessels 400m and 100000 tons, Ref vessel (8000 TEU)

Covered and uncovered storage areas to optimize loading and unloading of ships

#### **Container terminal**

350m
300,000TEU/YEAR
10ha container storage area
4 weighing stations
Onboard and onshore handling equipment

### **PORT'S SERVICES**

#### **SOVEREIGN**

Administratio ns whose efficiency of procedures to facilitate the flow of traffic

Customs Protection of the environment Phyto control Security (scanning) Quality control

#### **VESSELS** Piloting

Towing;

Mooring;

Parking;

## EXISTING ROADS IN PORT CITY - KRIBI

8.88

## HINTERLAND PORT CONNECTING ROAD - KRIBI

#### FURTHER DEVELOPMENT OF THE PORT OF KRIBI

Consists in the development of an addition 143 hectares in which will comprise several specialized terminals (hydrocarbon,

aluminum, textile,...)

#### Phase 3

#### Phase 2

Consists in the development of an addition **81 hectares** in which will comprise an additional **700 m of quay space** for 2 the container, multi purpose and hydrocarbons terminal and additional **processing capacity of 1.2 million TEUs**, reception of **ships with 8000 TEUs**. Commissioning by **2022** 

#### Phase 1

This phase which is already done consisted in the **43 hectares** in which were built among others, 2 Terminals, a multipurpose terminal and a containerized terminal Emergence by 2035 - 2040

#### **DEVELOPMENT OF INDUSTRAL ZONES**

Opportunities for industrial fishing in Cameroonian waters off the coast of Kribi

Its fertile soils make the production and processing and export cocoa possible

The potential for the construction of hydrocarbon and mineral processing units, refineries, gas treatment plants

Favorable climatic conditions also make the processing and export of coffee profitable

Cameroon's vast woodland provides numerous opportunities in wood processing

Opportunities for natural rubber processing and export

#### **DEVELOPMENT OF A LOGISTIC ZONES**

This logistics zone will cover a land area of 6000 ha and will be divided into 7 functional zones

Public zone to provide public service including trade center and commercialresidential area

Fishery product trading center used for pisciculture

Mechanical Equipment Storage zone with a land area of 15.6 ha for mechanical industry development

Container service zone with a land area of 8,2 ha for container service development

Steel production logistic zone with a land area of 15,08 ha for steel processing development

Integrated storage zone with a land area of 74.9 ha for development of integrated industry

Container truck service center with a land area of 14.2 ha for truck service development

#### **DEVELOPMENT OF A NEW CITY**

The existence and continuous development of the PAK provides investment opportunities in an emerging economy and the development / construction of a new city

Opportunities in social housing projects

Construction of international standard hotels

Creation of financial centers

Construction of amusement parks

## Creation of recreational parks

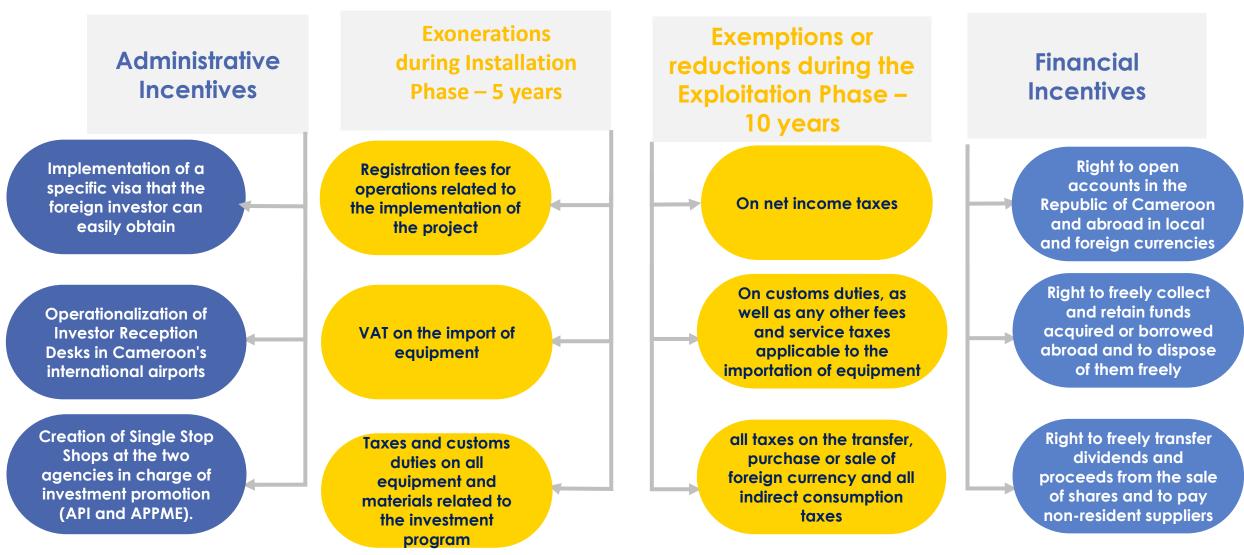

Construction of urban highways

#### **INVESTMENT INCENTIVES**

Cameroon passed an innovative law in 2013 to promote and attract Foreign Direct Investment (FDI) on its territory, allowing for domestic and foreign investors to access tax, customs, financial and administrative incentives without discrimination

#### **DEVELOPMENT OF TRANSPORT FACILITIES**

The strategy for the development of transport infrastructure is based, among other things, on the objectives of densification and improvement of their quality. A multimodal approach is now favored, in order to build an integrated, efficient and cost-effective transport network that covers the entire national territory and neighboring countries.

In the road sector, the main objective is to increase the current proportion of the paved road network by 2035. The intensification of asphalting of dirt roads and tracks will focus on the corridors of the CEMAC network, the Trans-African Highway and the internal structuring network in order to significantly improve the level of service of the network in good condition

## LAND CONNECTIVITY

The short and medium-term objective is to improve the condition of the existing rail network. On the one hand it will complete the economic integration of the country's northern and southern areas and, on the other hand, open up neighbouring countries that do not have access to the sea. The following links are preferred:

- Kribi-Ebolowa-Mbalam ;
- Limbe Douala Edéa -Kribi;
- Ngaoundéré-Garoua-Maroua-Maroua-Kousseri;
- Edéa-Yaoundé Ngaoundal

Additionally, the port complexes will be linked by rail to the rest of the country

## **CONNECTIVITY VIA RAIL**

development Several projects earmarked in the future will contribute to the development of inland water ways, project such as the construction of the Limbe sea port, and the construction of the Limbe Oil Yard. These projects express Cameroon's ambition to offer the countries bordering the Gulf of Guinea and the operators, a modern and shipyard, competitive equally offering opportunities of trade and development via coastal shipping routes.
