

A Single Digital Ecosystem for Terminal Management as Part of the Global Information Environment Connecting All the Elements of the Supply Chain

*Giovanni Migliaccio,
Vice President Sales & Marketing, Solvo Europe B.V.*

26
years
of success

Solutions for ports and terminals

A leading Terminal Operating System for ports and terminals. An ultimate set of solutions for managing just any type of cargo: container, break bulk, Ro-Ro, general cargo, etc., including extra solutions as the VBS, AGMS, VGM.

Solutions for yard management

YMS helps to manage all the operations at the yards, including allocation and storage of different types of cargo, housekeeping, reefer and empty containers management, CFS management etc. Providing procurement of gate-entry/ cargo pick-up permits for truck-drivers, trucks and cargo forwarders/ transport companies.

Solutions for warehouse logistics

One of the leading software providers of SCE software. Solutions range from WMS to WCS, Yard, Billing, KPI and more for all verticals: production, retail and distribution, 3PL and pharmaceuticals.

Consultancy in logistics

Logistics and Management consultants, including specializations for Project Management, Optimization, Engineering, Design and Procurement.

As well as training, seminars, webinars and other educational events. Own competence center based on a 30 000 m2 3PL warehouse.

Developed first WMS, TOS and Introduced the very 1st RDT in Russia in the 1990s

Leader of cabin mounted mobile computers sales in Russia

ISO 9001:2015 certified

26 years of success
400 projects
200 employees

International certification

Member of leading software and international trade associations

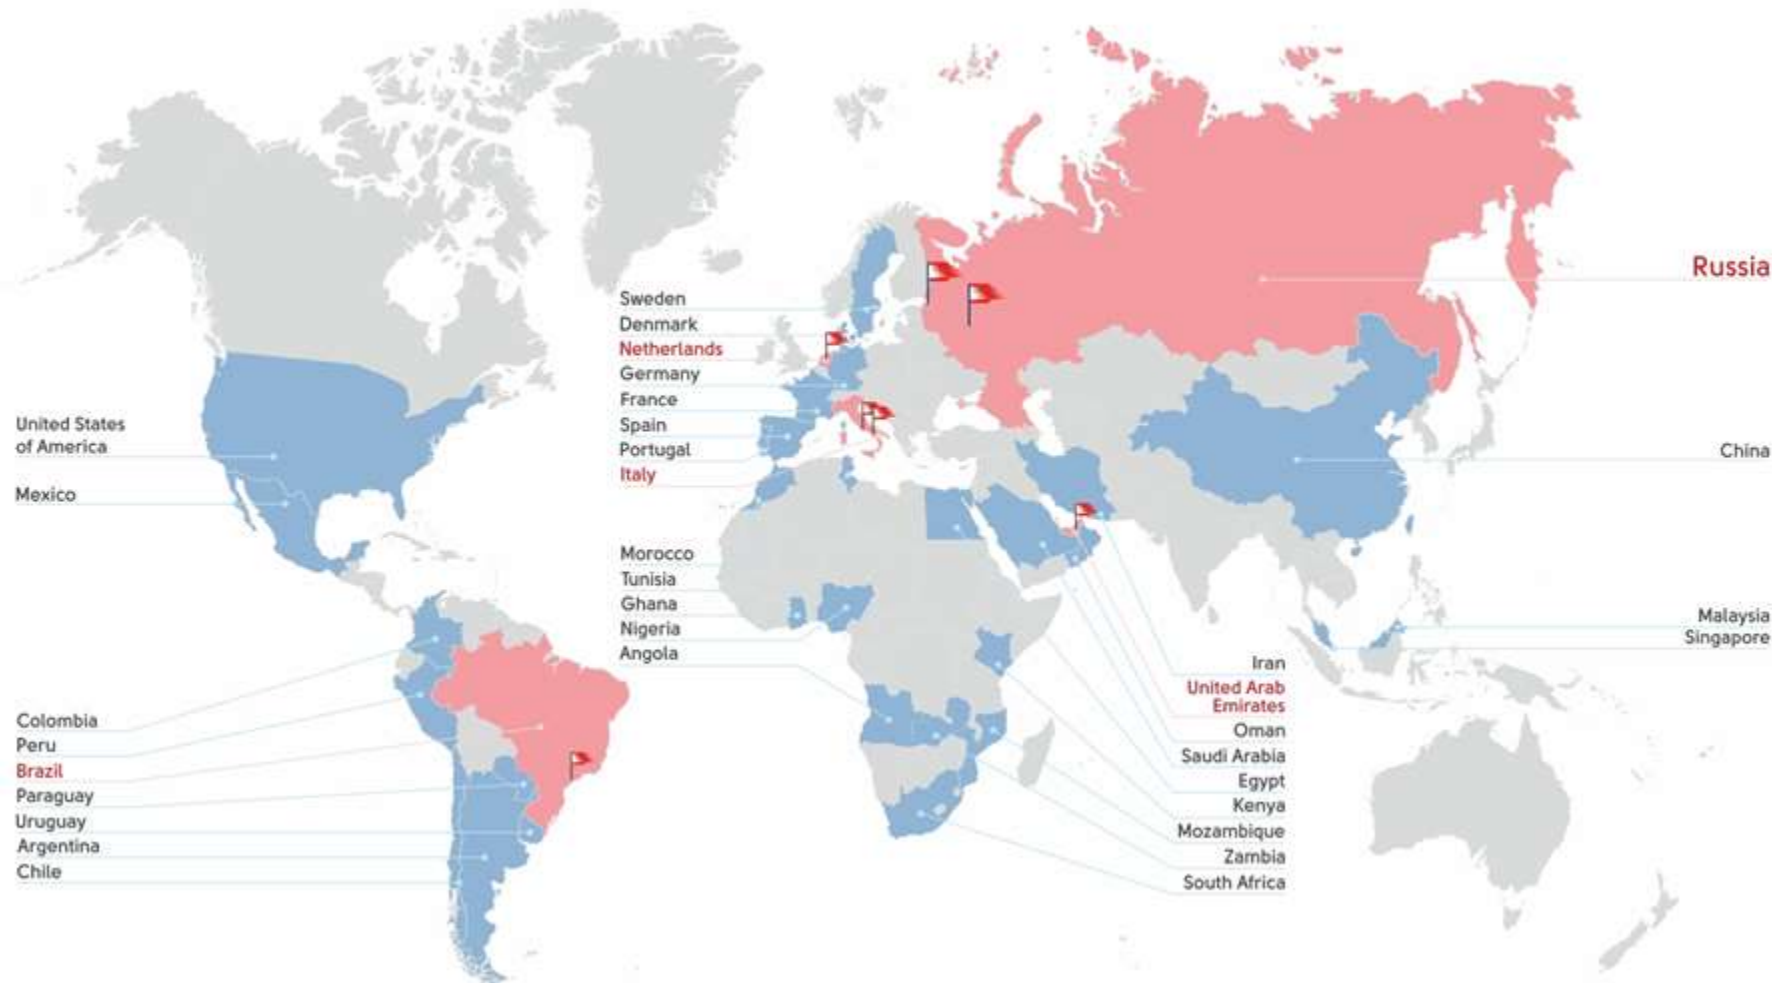

70% of all containers in CIS countries are processed by Solvo.TOS

400+ projects

SOLVO international offices and partners

 SOLVO partners

 SOLVO offices:

HQ: Saint-Petersburg, Russia

International office for Europe: The Hague, The Netherlands

International office for Middle East: Dubai, UAE

International office for Mediterranean: Naples, Italy

Representative office: Moscow, Russia

Representative office: Rome, Italy

Representative office: Brazil, Sao Paulo

Modern ports are moving to Extended Supply Chain

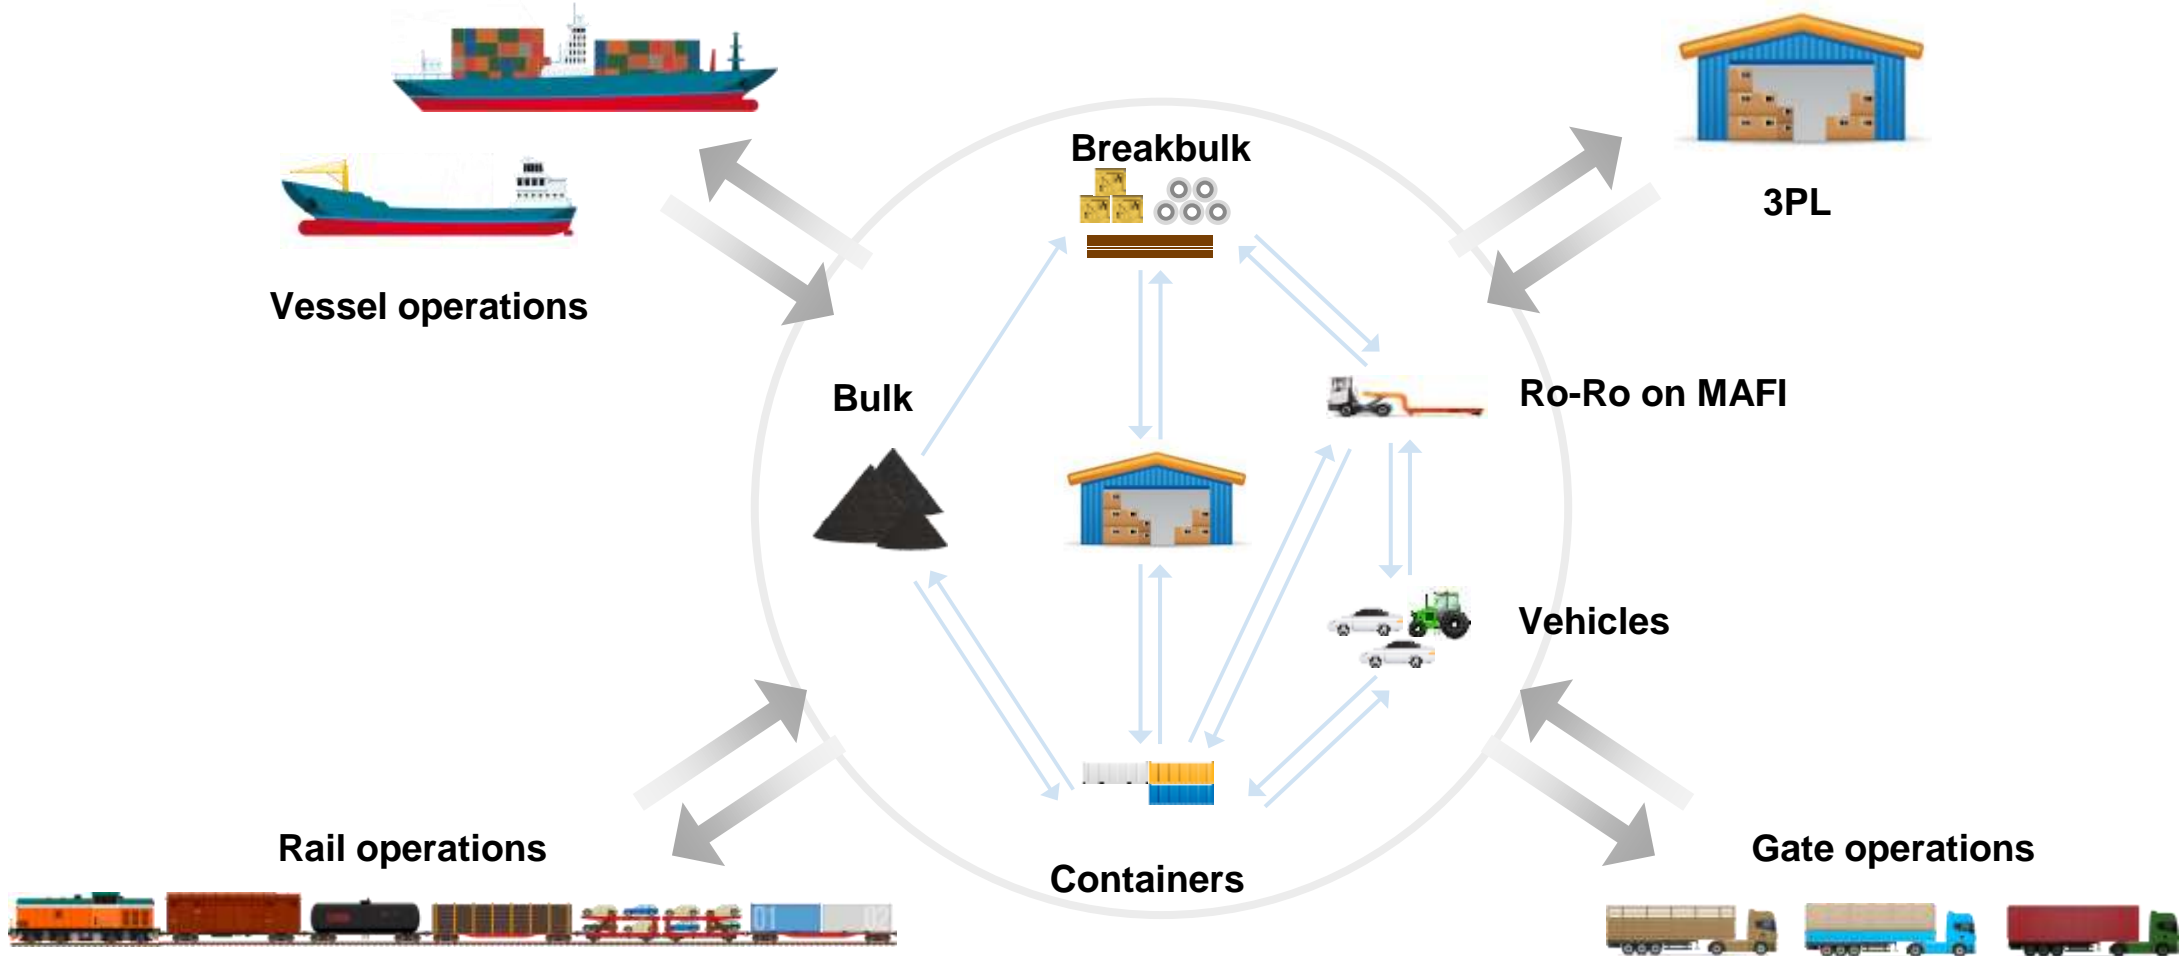

Moving to Global Supply Chain

Global Information Environment Connecting All the Elements of the Supply Chain

End to End visibility - to final customer

=

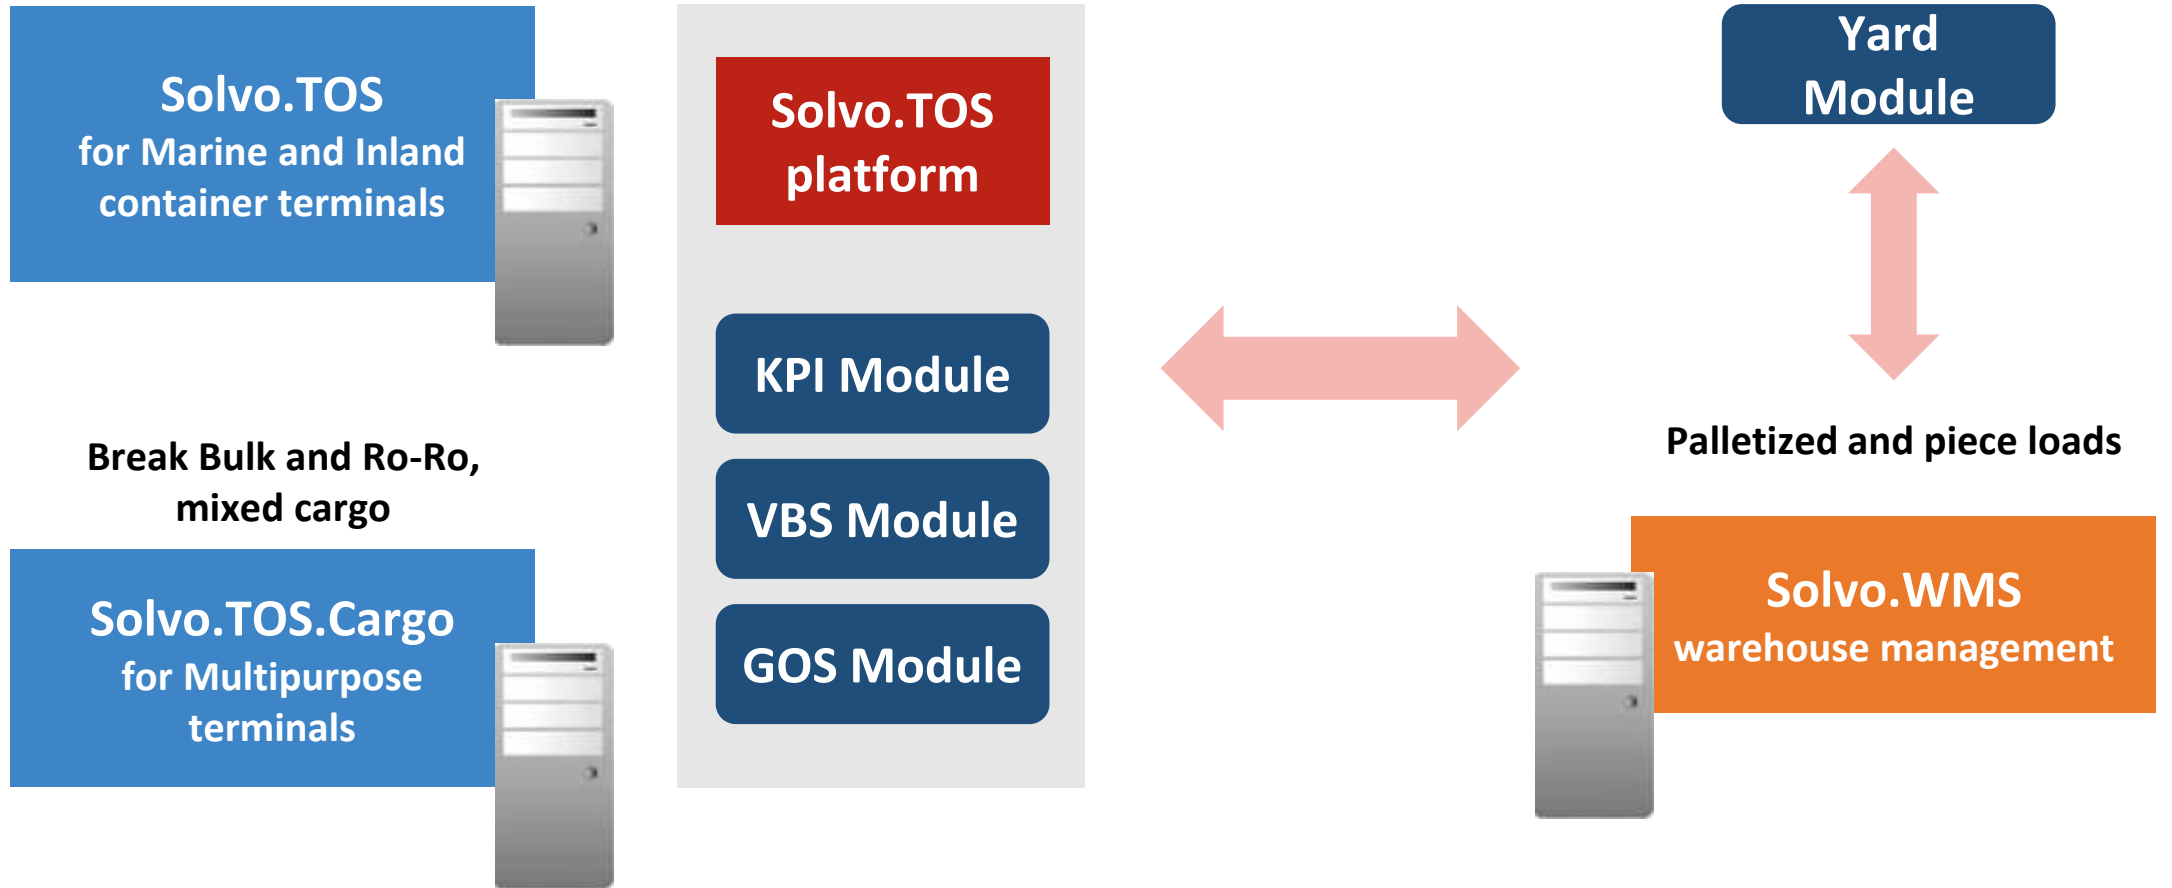

Modern TOS as a full Supply Chain solution and an integration platform

- ① The different document format leads to problems with information exchange between various stakeholders in the supply chain;
- ① Poor planning cause delaying with the cargo delivery time and confusions due to lack of required information;
- ① Inability to track the status and current location along the extended Supply Chain ;
- ① Manual planning of personnel and equipment operations not feasible due to the increase of task and works, impacting into the processing time significantly.

Containers

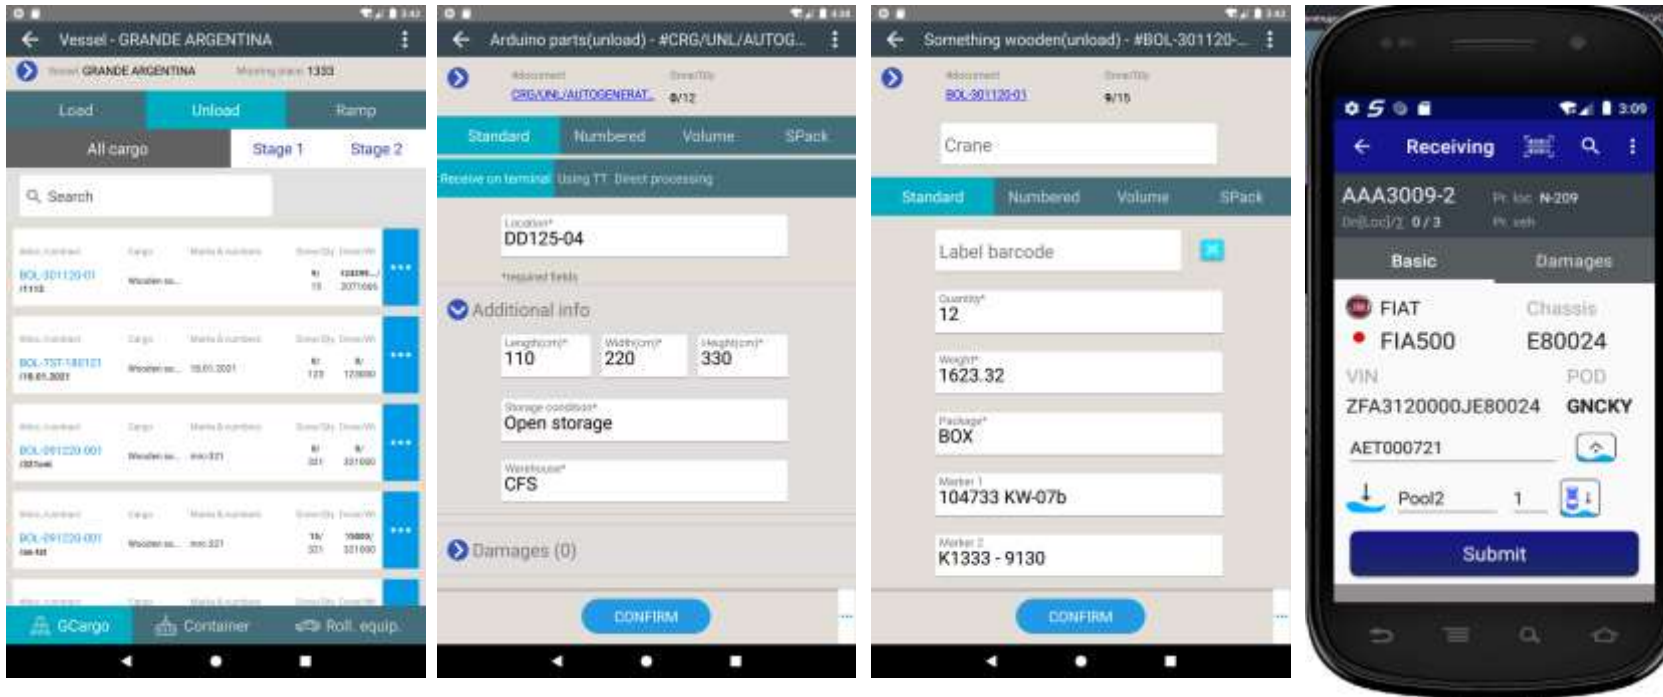

Solvo.TOS is able to handle a wide variety of cargo types, including:

- Containers
- Bulk goods (fertilizers, grain, pellets, etc.);
- Ro-Ro
- Goods packed in bags and boxes (cacao, sugar, rice);
- Construction materials;
- Sawn material, round timber;
- Metals (ferrous and non-ferrous);
- Food, including perishable food (meat products, fruits);
- Paper (in rolls and on pallets) and pulp;
- Metal waste, machines;

The system is creating for every cargo type dedicated business rules, with precise definition of what can be done with them, by whom and when.

Among cargo characteristics processed by Solvo.TOS:

Package type, weight, quantity, dimensions (length, width, height), marking (label), markers.

For each cargo type the system can have specific characteristics, for example, cars:

VIN number, color, mode, dimensions (length, width), weight, type.

Server components:

- *Java SE as main language;*
- *C++ for time critical parts*

Desktop GUI clients:

- *Declarative XML Forms;*
- *Native C++ runtime for Windows and Linux*

Web clients:

- *Declarative XML, SOAP, WSDL;*
- *Program web-server based on Apache httpd.*

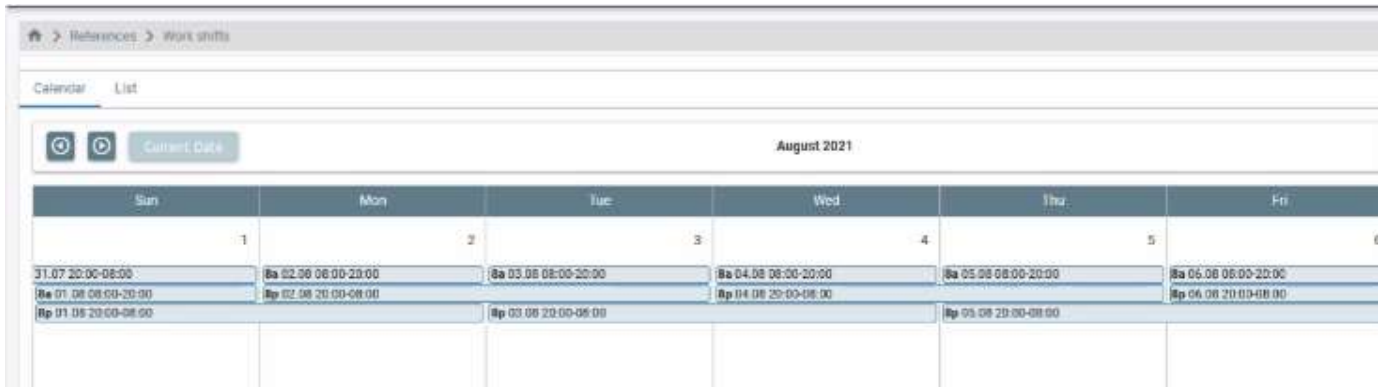

Mobile clients:

- *Declarative XML Forms;*
- *Text based VT100 compatible*

Equipment and personnel management

EQUIPMENT ISSUANCE: WORK SHIFT:

Thanks to aggregating data and reports on employee productivity—either individually or for groups— the system provides visibility where terminals are allocating their labor budgets and help them to optimize human assets.

The typical scenario is that the daily shift plan is calculated in advance and created ad hoc reports at the end of each shift, including information by: job function, operator and equipment, tasks and time of day. Each work order is analyzing the throughput and productivity rates by associating these values

Solvo.TOS creates TA using time slotting technology, means that it is possible to choose convenient date and time for transport vehicle and get a guarantee that truck will be processed within a chosen time window.

It allows to plan, manage and monitor the progress of cargo loading / unloading based also on ETA / ETD

Truck appointment is created by forwarders or other external users through the Web portal using time slotting technology;

Allows to avoid long queues at the terminal gate.

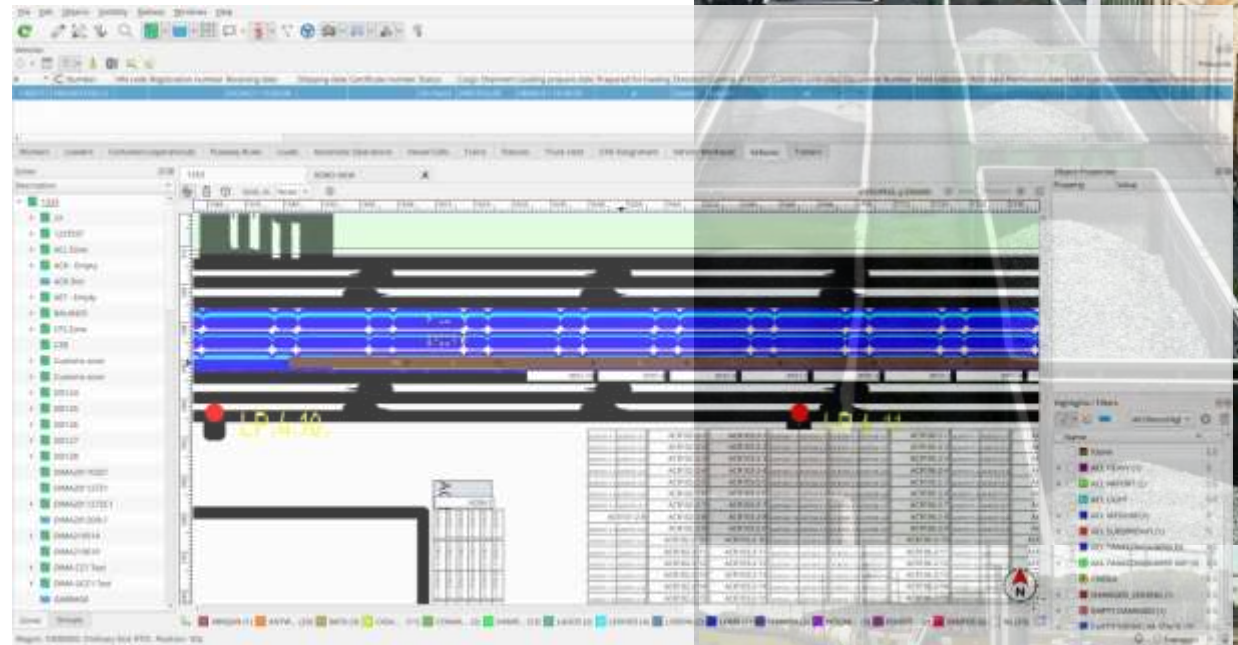

Always possible to check the visit status.

The screenshot displays the Solvo.TOS interface. At the top, there's a 'SLOT REQUEST' section with a grid of time slots. Below that, a 'Planned calls' section shows a grid of appointment details. On the right, a bar chart shows the number of trucks per hour. At the bottom, a table shows the current status of trucks at 11:52.

Processing		Standby					
Time slot	Status	Plate number	Duration	Plate number	Duration	Plate number	Duration
11:00 - 13:00	Processing	8702K178	4 min	8532D178	25 min		
13:30 - 15:30	Standby	4408HT190	4 min	A348C006	32 min

		H050TC178	20 min				
		89528P178	24 min				
		B106CB178	24 min				

The system can perform automatic scheduling on the railroad, operating such data as:

- Cargo information;
- Railcars parameters:
 - Railcar Reference - Determines railcar length, owner, time to scheduled repair, etc.;
 - Railcar parameters: loaded from an external system, or filled in by the tallyman via RDT during registration;
 - Cargo putaway specifications;
- Various types of documents, based on which loading and unloading of railcars is carried out;
- Planning, managing and monitoring the progress of loading / unloading trains based on ETA / ETD (estimated time of arrival / departure).

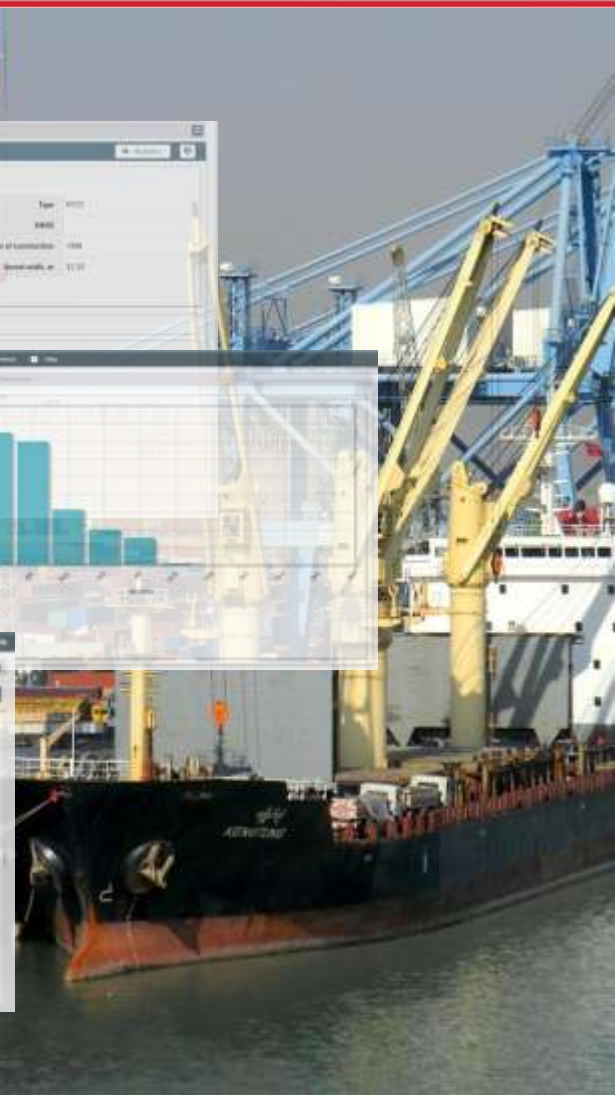

65966343

Vessel operations management starts with vessel calls registration, including detailed information about the technical specifications and unique vessel structure. The information is added just once, during 1st vessel call and used for the future visits.

After vessel calls are registered Solvo.TOS creates the monthly/weekly work schedule based on notices sent from Ship Agents; Vessel calls can be created manually by the planner or automatically based on the data from external systems and notices.

The TOS keeps track of all vessel calls and displays their status in real time, e.g. berthing, discharging, loading, departure.

Web portal is created to provide possibility for external terminal users to interact with the TOS system

Improved quality of service without increasing the number of personnel:

- The client creates a visit for a specific time;
- The client selects the date, time-slot and cargo specs;
- The client can independently monitors the cargo status;
- Ability to charge for visit requests and additional services via the web-portal.

The KPI module is designed to graphically represent statistical and dynamic data about the operation of the cargo terminal.

All indicators can be divided into two types according to the frequency of data updating:

Operational - reflect the current state of the terminal, require a high update rate (minute, performed operation);

Statistical - reflect the state of the terminal for a certain period of time (data is updated at the user's request).

Groups of indicators for a cargo terminal:

- General indicators of terminal performance (such as total cargo turnover, terminal turnover);
- Indicators of the efficiency of the cargo fronts: ship, road, rail;
- Indicators of the efficiency of the warehouse area;
- Staff work efficiency;
- The effectiveness of the use of technics.

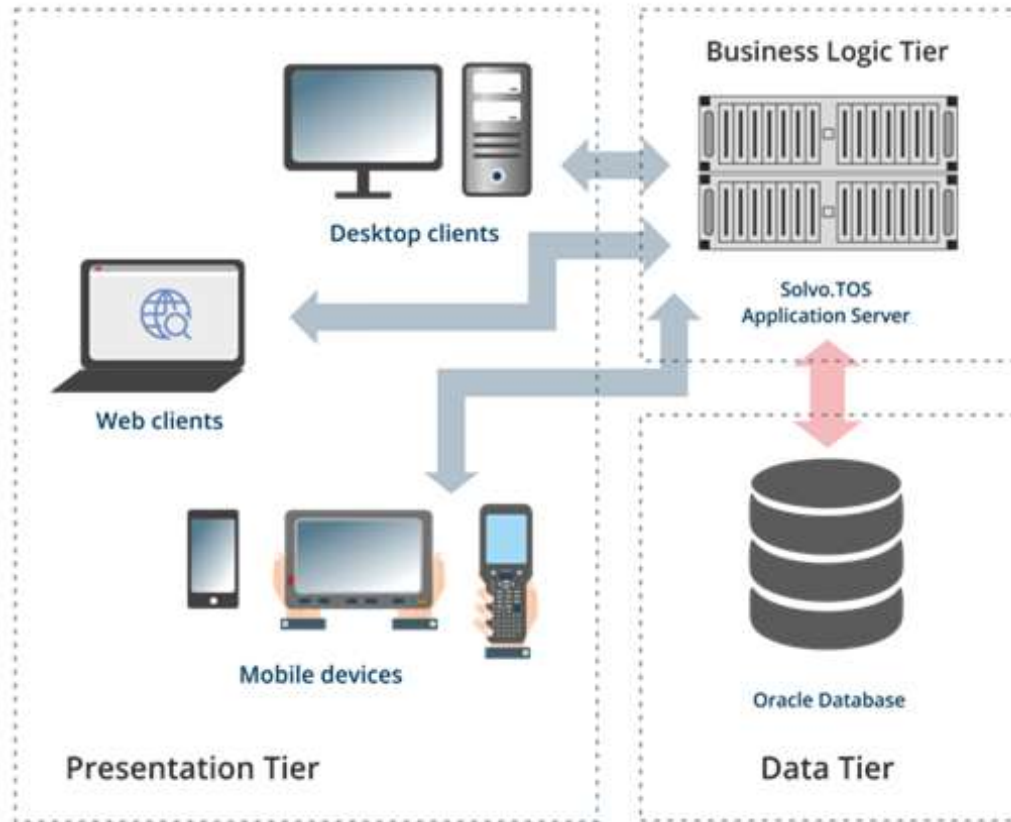

Solvo.API is responsible for data exchange, which has two modules of its own: EDI module is used to receive and convert data from external information systems, Notifier module prepares messages in the right format for external information systems when certain events occur.

A unified communication system between representatives of the Caspian region and the so-called new Silk Road was proposed in October 2020 and successfully implemented in 2021.

The main advantage of the unified information system for logistics operators is one-stop communication, which allows quick and easy exchange of information, timely receipt of necessary data for carrying out logistics operations, saving time and resources.

Solvo.TOS

Solvo.TOS transmits into a single digital space the vessel data and their characteristics, information about passengers, containers, general and rolling cargoes.

- Communication between ports has become easier;
- No additional human resources are required to transfer information into the system;
- Reduction of the human errors in data exchange;
- Simplification of the planning of daily tasks.

The joint solution of SOLVO and DBA Group as result increased the efficiency of vsl planning, passenger flow and related security services, accelerating drastically the processes of document flow.

- ★ Increase cargo handling efficiency & terminal throughput;
- ★ Increase personnel & equipment productivity;
- ★ Improve transparency of technological and commercial processes;
- ★ Increase in load handling speed in the storage zone;
- ★ Reduction in re-handles (nonproductive container moves);
- ★ Eliminating human factor;
- ★ Improving health and safety ops;
- ★ Finding efficiencies in processes and logistics;
- ★ Improving margins;
- ★ Reducing operating costs.
